[a] For a narrow resonance in the range 2.2 < M(X) < 2.8 GeV.

CONSTRAINED FIT INFORMATION

A multiparticle fit to $\chi_{c1}(1P),\ \chi_{c0}(1P),\ \chi_{c2}(1P),\$ and $\psi(2S)$ with 4 total widths, a partial width, 25 combinations of partial widths obtained from integrated cross section, and 84 branching ratios uses 223 measurements to determine 49 parameters. The overall fit has a $\chi^2=312.2$ for 174 degrees of freedom.

The following off-diagonal array elements are the correlation coefficients $\left\langle \delta \rho_i \delta \rho_j \right\rangle / (\delta \rho_i \cdot \delta \rho_j)$, in percent, from the fit to parameters ρ_i , including the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\rm total}$.

$\psi(2S) \Gamma(i)\Gamma(e^+e^-)/\Gamma(total)$

This combination of a partial width with the partial width into $e^+\,e^-$ and with the total width is obtained from the integrated cross section into channel(i) in the $e^+\,e^-$ annihilation. We list only data that have not been used to determine the partial width $\Gamma(i)$ or the branching ratio $\Gamma(i)/total$.

 11 ANASHIN 12 reports the value 2.233 \pm 0.015 \pm 0.037 \pm 0.020 keV, where the third uncertainty is due to assumptions on the interference between the resonance and hadronic continuum. We combined the two systematic uncertainties.

 $\Gamma(J/\psi(1S)\pi^+\pi^-) \times \Gamma(e^+e^-)/\Gamma_{\text{total}}$ $\Gamma_{11}\Gamma_6/\Gamma_{\text{NALUE}(keV)}$ $\Gamma_{12}\Gamma_{13}\Gamma_{14}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_{15}\Gamma_$

$\psi(3770)$ DECAY MODES

In addition to the dominant decay mode to $D\overline{D}$, $\psi(3770)$ was found to decay into the final states containing the J/ψ (BAI 05, ADAM 06). ADAMS 06 and HUANG 06A searched for various decay modes with light hadrons and found a statistically significant signal for the decay to $\phi\eta$ only (ADAMS 06).

CONSTRAINED FIT INFORMATION

An overall fit to the total width, a partial width, and 3 branching ratios uses 23 measurements and one constraint to determine 5 parameters. The overall fit has a $\chi^2=$ 20.0 for 19 degrees of

The following off-diagonal array elements are the correlation coefficients $\langle \delta
ho_i \delta
ho_j \rangle / (\delta
ho_i \cdot \delta
ho_j)$, in percent, from the fit to parameters ho_i , including the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\rm total}$. The fit constrains the x_i whose labels appear in this array to sum to one.

$$\begin{array}{c|ccccc}
x_3 & 98 & & & \\
x_8 & 0 & 0 & & \\
\Gamma & 0 & 0 & -44 & & \\
\hline
x_2 & x_3 & x_8 & & & \\
\end{array}$$

- Taking into account interference between the resonant and non-resonant $D\overline{D}$ production. 11 Reanalysis of data presented in BAI 02c. From a global fit over the center-of-mass energy region 3.7-5.0 GeV covering the $\psi(3770)$, $\psi(4040)$, $\psi(4160)$, and $\psi(4415)$ resonances. Phase angle fixed in the fit to $\delta=0^\circ$.
- 12 Interference between the resonant and non-resonant $^{D}\overline{D}$ production not taken into ac-
- count. 13 BESSON 06 (as corrected in BESSON 10) measure $\sigma(e^+e^- \to \psi(3770) \to \text{hadrons})$ = $6.36\pm0.08^{+}_{-}0.30$ nb at $\sqrt{s}=3773\pm1$ MeV, and obtain Γ_{ee} from the Born-level cross section calculated using $\psi(3770)$ mass and width from our 2004 edition, PDG 04.
- 14 Solution II of the two solutions. 15 See also $\Gamma\left(e^{+}\,e^{-}\right)/\Gamma_{\rm total}$ below.

X(3872)

$$I^{G}(J^{PC}) = 0?(?^{?+})$$

Seen by CHOI 03 in $B \to K \pi^+ \pi^- J/\psi(1S)$ decays as a narrow peak in the invariant mass distribution of the $\pi^+\pi^-J/\psi(1S)$ final state, but not seen in the $\gamma\chi_{c1}$ final state of these decays. Possibly absent in the invariant mass spectrum of the final state $\pi^+\pi^-J/\psi(1S)$ in $e^+\,e^-$ collisions. Interpretation as a 1 $^-$ charmonium state not favored. Isovector hypothesis excluded by AUBERT 05B and CHOI 11. A helicity amplitude analysis of the $X(3872) \rightarrow J/\psi \pi^+ \pi^-$ decay gives two possible J^{PC} assignments: $J^{PC}=1^{++}$ and 2^{-+} (ABULENCIA 07E and CHOI 11). A study of the 3π invariant mass distribution in $J/\psi\omega$ decays slightly favors $J^P=2^-$ (DEL-AMO-SANCHEZ 10B).

See our note on "Developments in Heavy Quarkonium Spectroscopy".

¹⁵ With a measured value of B(B $\rightarrow X(3872) K) \times B(X(3872) \rightarrow D^{*0} \overline{D}^{0}) = (0.80 \pm 1.00)$ $0.20 \pm 0.10) \times 10^{-4}$, assumed to be equal for both charged and neutral modes.

 $^{0.11\,\}pm\,0.46\,\%$ from ATHAR 04, $\psi(2S)$ mass and = 2.54 \pm 0.03 \pm 0.11 keV from ADAM 06.

COAN 06A and BRIERE 06.

^{0.11} \pm 0.54 % from ATHAR 04, $\psi(2S)$ mass and $= 2.54 \pm 0.03 \pm 0.11$ keV from ADAM 06.

 $^{(1.89 \}pm 0.20 \pm 0.20) \times 10^{-3}$ from ADAM 06.

 $^{^{34}}$ Uses B(\(\psi(2S)\) \rightarrow \gamma_{\chi_0}() = 9.33 \pm 0.14 \pm 0.61 \% from ATHAR 04, \(\psi(2S)\) mass and width from PDG 04, and \(\Gamma_{\chi_0}(\psi(2S)) = 2.54 \pm 0.03 \pm 0.11 \text{ keV from ADAM 06.} \)

³⁵ Not independent of other results in BRIERE 06.

 $^{^{36}}$ Assuming maximal destructive interference between $\psi(3770)$ and continuum sources.

 $^{^2}$ Width consistent with detector resolution. 3 A possible equal mixture of two states with a mass difference greater than 3 6 MeV/c 2 is excluded at 9 5% CL.

⁴ Calculated from the corresponding $m_{X(3872)}-m_{J/\psi}$ using $m_{J/\psi}$ =3096.916 MeV.

 $^{^{5}}$ Calculated from the corresponding $m_{\chi(3872)}-m_{\psi(2S)}$ using $m_{\psi(2S)}=$ 3686.093 MeV. Superseded by AUBERT 08Y.

 $^{^6}$ Calculated from the corresponding $m_{X(3872)}-m_{\psi(2S)}$ using $m_{\psi(2S)}=$ 3685.96MeV. Superseded by AUBERT 06.

⁷ Superseded by AALTONEN 09AU.

⁸ Superseded by CHOI 11.

⁹ A lower mass value can be due to an incorrect momentum scale for soft pions.

¹¹ Experiments report $D^{*0} \overline{D^0}$ invariant mass above $D^{*0} \overline{D^0}$ threshold because D^{*0} decay products are kinematically constrained to the D^{*0} mass, even though the D^{*0} may decay

off-shell.

12 Superseded by AUSHEV 10.

ψ (4040) DECAY MODES

Due to the complexity of the $c\overline{c}$ threshold region, in this listing, "seen" ("not seen") means that a cross section for the mode in question has been measured at effective \sqrt{s} near this particle's central mass value, more (less) than 2σ above zero, without regard to any peaking behavior in \sqrt{s} or absence thereof. See mode listing(s) for details and references.

| | Mode | Fraction (Γ_i/Γ) | Confidence level |
|----------------|------------------------------------------------------|------------------------------|------------------|
| Γ ₁ | $e^+ e^-$ | $(1.07 \pm 0.16) \times 10$ | ₀ –5 |

15 From several values of \sqrt{s} near the peak of the $\psi(4040)$, PEDLAR 11 measures $\sigma(e^+e^-\to h_C(1P)\,\pi^+\pi^-)=1.0\pm 8.0\pm 5.4\pm 0.2$ pb, where the errors are statistical, systematic, and due to uncertainty in $\mathrm{B}(\psi(2S)\to\pi^0\,h_C(1P))$, respectively.

 $^{^{5}}$ Reanalysis of data presented in BAI 02c. From a global fit over the center-of-mass energy region 3.7–5.0 GeV covering the $\psi(3770)$, $\psi(4040)$, $\psi(4160)$, and $\psi(4415)$ resonances. Phase angle fixed in the fit to $\delta=(293\pm57)^\circ$.

Primage angle fixed in the interest to $\theta=(233\pm37)$. 2 Reanalysis of data presented in BAI 00 and BAI 02c. From a global fit over the center-of-mass energy 3.8-4.8 GeV covering the $\psi(4040)$, $\psi(4160)$ and $\psi(4415)$ resonances and including interference effects. 3 From a fit to Crystal BaII (OSTERHELD 86) data.

⁴ From a fit to BES (BAI 02c) data.

Reanalysis of data presented in BAI 00 and BAI 02c. From a global fit over the center-of-mass energy 3.8-4.8 GeV covering the $\psi(4040), \psi(4160)$ and $\psi(4415)$ resonances and including interference effects. From a fit to Crystal Ball (OSTERHELD 86) data. From a fit to BES (BAI 02c) data.

 ψ (4160)

$\psi(4160)$ DECAY MODES

Due to the complexity of the $c\overline{c}$ threshold region, in this listing, "seen" One of the company of the centimeshold region, in this histing, seen ("not seen") means that a cross section for the mode in question has been measured at effective \sqrt{s} near this particle's central mass value, more (less) than 2σ above zero, without regard to any peaking behavior in \sqrt{s} or absence thereof. See mode listing(s) for details and references.

⁹ Reanalysis of data presented in BAI 02c. From a global fit over the center-of-mass energy region 3.7-5.0 GeV covering the $\psi(3770)$, $\psi(4040)$, $\psi(4160)$, and $\psi(4415)$ resonances. Phase angle fixed in the fit to $\delta=(293\pm57)^\circ$. ¹⁰ Reanalysis of data presented in BAI 00 and BAI 02c. From a global fit over the center-of-mass energy 3.8-4.8 GeV covering the $\psi(4040)$, $\psi(4160)$ and $\psi(4415)$ resonances and including interference effects. Four sets of solutions are obtained with the same fit quality, mass and total width, but with different e^+e^- partial widths. We quote only the cange of values the range of values.

11 From a fit to Crystal Ball (OSTERHELD 86) data.

¹² From a fit to BES (BAI 02c) data.

ψ (4415) DECAY MODES

Due to the complexity of the $c\,\overline{c}$ threshold region, in this listing, "seen" ("not seen") means that a cross section for the mode in question has been measured at effective \sqrt{s} near this particle's central mass value, more (less) than 2σ above zero, without regard to any peaking behavior in \sqrt{s} or absence thereof. See mode listing(s) for details and references.

| | Mode | Fraction (Γ_i/Γ) | Confidence level |

$b\overline{b}$ MESONS

THE BOTTOMONIUM SYSTEM

The level scheme of the $b\bar{b}$ states showing experimentally established states with solid lines. Singlet states are called η_b and h_b , triplet states Υ and χ_{bJ} . In parentheses it is sufficient to give the radial quantum number and the orbital angular momentum to specify the states with all their quantum numbers. E.g., $h_b(2P)$ means 2^1P_1 with n=2, L=1, S=0, J=1, PC=+-. The figure shows observed hadronic transitions. The single photon transitions $\Upsilon(nS) \to \gamma \eta_b(mS)$, $\Upsilon(nS) \to \gamma \chi_{bJ}(mP)$, and $\chi_{bJ}(nP) \to \gamma \Upsilon(mS)$ are omitted for clarity.

WIDTH DETERMINATIONS OF THE Υ STATES

As is the case for the $J/\psi(1S)$ and $\psi(2S)$, the full widths of the $b\overline{b}$ states $\Upsilon(1S)$, $\Upsilon(2S)$, and $\Upsilon(3S)$ are not directly measurable, since they are much narrower than the energy resolution of the e^+e^- storage rings where these states are produced. The common indirect method to determine Γ starts from

$$\Gamma = \Gamma_{\ell\ell}/B_{\ell\ell} \ , \tag{1}$$

where $\Gamma_{\ell\ell}$ is one leptonic partial width and $B_{\ell\ell}$ is the corresponding branching fraction ($\ell = e, \mu$, or τ). One then assumes $e^{-\mu-\tau}$ universality and uses

$$\Gamma_{\ell\ell} = \Gamma_{ee}$$

$$B_{\ell\ell} = \text{average of } B_{ee}, \ B_{\mu\mu}, \ \text{and } B_{\tau\tau} \ .$$
 (2)

The electronic partial width Γ_{ee} is also not directly measurable at e^+e^- storage rings, only in the combination $\Gamma_{ee}\Gamma_{\rm had}/\Gamma$, where $\Gamma_{\rm had}$ is the hadronic partial width and

$$\Gamma_{\text{had}} + 3\Gamma_{ee} = \Gamma \ . \tag{3}$$

This combination is obtained experimentally from the energy-integrated hadronic cross section

$$\int \sigma(e^+e^- \to \Upsilon \to \text{hadrons})dE$$

resonance

$$= \frac{6\pi^2}{M^2} \frac{\Gamma_{ee} \Gamma_{had}}{\Gamma} C_r = \frac{6\pi^2}{M^2} \frac{\Gamma_{ee}^{(0)} \Gamma_{had}}{\Gamma} C_r^{(0)} , \qquad (4)$$

where M is the Υ mass, and C_r and $C_r^{(0)}$ are radiative correction factors. C_r is used for obtaining Γ_{ee} as defined in Eq. (1), and contains corrections from all orders of QED for describing $(b\overline{b}) \to e^+e^-$. The lowest order QED value $\Gamma_{ee}^{(0)}$, relevant for comparison with potential-model calculations, is defined by the lowest order QED graph (Born term) alone, and is about 7% lower than Γ_{ee} .

The Listings give experimental results on B_{ee} , $B_{\mu\mu}$, $B_{\tau\tau}$, and $\Gamma_{ee}\Gamma_{\rm had}/\Gamma$. The entries of the last quantity have been re-evaluated consistently using the correction procedure of KU-RAEV 85. The partial width Γ_{ee} is obtained from the average values for $\Gamma_{ee}\Gamma_{\rm had}/\Gamma$ and $B_{\ell\ell}$ using

$$\Gamma_{ee} = \frac{\Gamma_{ee} \Gamma_{had}}{\Gamma(1 - 3B_{\ell\ell})} \ . \tag{5}$$

Bottomonium, $\eta_b(1S)$, $\Upsilon(1S)$

The total width Γ is then obtained from Eq. (1). We do not list Γ_{ee} and Γ values of individual experiments. The Γ_{ee} values in the Meson Summary Table are also those defined in Eq. (1).

 $I^{G}(J^{PC}) = 0^{+}(0^{-+})$

OMITTED FROM SUMMARY TABLE

Quantum numbers shown are quark-model predictions. Observed in radiative decay of the $\Upsilon(3S)$, therefore C=+.

⁸ BESSON 07 reports [$\Gamma(\Upsilon(1S) \rightarrow \ \tau^+ \ \tau^-)/\Gamma_{total}$] / [B($\Upsilon(1S) \rightarrow \ \mu^+ \ \mu^-$)] = 1.02 ± 0.02 ± 0.05 which we multiply by our best value B($\Upsilon(1S) \rightarrow \mu^+ \mu^-) = (2.48\pm0.05) \times$ 10^{-2} . Our first error is their experiment's error and our second error is the systematic error from using our best value.

9 Using B($\Upsilon(1S)
ightarrow e\,e) =$ B($\Upsilon(1S)
ightarrow \mu\mu) = 0.0256$; not used for width evaluations.

$\chi_{b0}(\overline{1P})$

$$I^G(J^{PC}) = 0^+(0^{++})$$

J needs confirmation.

Observed in radiative decay of the $\Upsilon(2S)$, therefore C=+. Branching ratio requires E1 transition, M1 is strongly disfavored, therefore

 $\Gamma(3\pi^+3\pi^-K^+K^-\pi^0)/\Gamma_{\text{total}}$

$$I^G(J^{PC}) = 0^+(1^{++})$$

 J needs confirmation.

Observed in radiative decay of the $\Upsilon(2S)$, therefore C=+. Branching ratio requires E1 transition, M1 is strongly disfavored, therefore P=+. J=1 from SKWARNICKI 87.

 $\chi_{b2}(1P)$

$$I^G(J^{PC}) = 0^+(2^{++})$$

J needs confirmation.

Observed in radiative decay of the $\Upsilon(2S)$, therefore C=+. Branching ratio requires E1 transition, M1 is strongly disfavored, therefore P = +. J = 2 from SKWARNICKI 87.
