AUBERT,BE 04B BABR Repl. by AUBERT 07N

ı

 1 Assumes equal production of B^+ and B^0 at the $\varUpsilon(45)$. 2 ABULENCIA 06J reports $[\Gamma(B^+\to \overline{D}{}^0\pi^+)/\Gamma_{\rm total}] \ / \ [B(B^0\to D^-\pi^+)] = 1.97 \pm 0.10 \pm 0.21$ which we multiply by our best value B($B^0\to D^-\pi^+) = (2.68 \pm 0.13) \times 10^{-1}$ 10^{-3} . Our first error is their experiment's error and our second error is the systematic error from using our best value.

 3 Uses a missing-mass method. Does not depend on D branching fractions or B^+/B^0 production rates.

AHMED 02B reports an additional uncertainty on the branching ratios to account for 4.5% uncertainty on relative production of B^0 and B^+ , which is not included here. ⁵ Assumes equal production of B^+ and B^0 at the T(4S) and uses the Mark III branching

6 BEBEK 87 value has been updated in BERKELMAN 91 to use same assumptions as

7 AUBERT, B 04P reports $[\Gamma(B^+ \to \overline{D}{}^0\pi^+)/\Gamma_{\text{total}}] \times [B(D^0 \to K^-\pi^+)] = (1.846 \pm 1.00)$ 0.032 ± 0.097) $\times 10^{-4}$ which we divide by our best value B($D^0 \rightarrow K^- \pi^+$) = (3.88 \pm $0.05) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

⁸ ALAM 94 assume equal production of B^+ and B^0 at the $\Upsilon(4S)$ and use the CLEOII absolute $\mathsf{B}(D^0\to K^-\pi^+)$ and the PDG 1992 $\mathsf{B}(D^0\to K^-\pi^+\pi^0)/\mathsf{B}(D^0\to K^-\pi^+)$ and $B(D^0\to K^-2\pi^+\pi^-)/B(D^0\to K^-\pi^+)$. 9 ALBRECHT 88k assumes $B^0\overline{B}^0:B^+B^-$ ratio is 45:55. Superseded by ALBRECHT 90J.

 $\Gamma(\overline{\mathcal{D}}{}^{0}\rho^{+})/\Gamma_{\mathrm{total}}$ Γ_{45}/Γ EVTS DOCUMENT ID TECN COMMENT

 5 ALBRECHT 9 OJ ARG $^{}$ e $^{+}$ e $^{-}$ \rightarrow $^{}$ r(4 $^{}$ S)

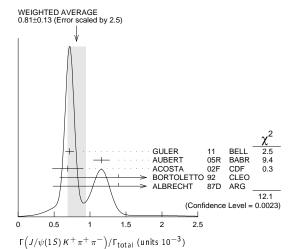

¹ Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

² ACOSTA 02F uses as reference of B(B \rightarrow J/ $\psi(1S)$ K $^{+}$) = (10.1 \pm 0.6) \times 10⁻⁴. The second error includes the systematic error and the uncertainties of the branching ratio. 3 BORTOLETTO 92 reports $(1.2\pm0.6\pm0.4)\times10^{-3}$ from a measurement of [\Gamma(B^+ \rightarrow

 ${\it J/\psi(1S)~K^+\,\pi^+\,\pi^-)/\Gamma_{\rm total}]~\times~[{\rm B}({\it J/\psi(1S)}~\rightarrow~e^+\,e^-)]~{\rm assuming}~{\rm B}({\it J/\psi(1S)}~\rightarrow~e^+\,e^-)$ $e^+e^-)=0.069\pm0.009$, which we rescale to our best value B $(J/\psi(1S)\to e^+e^-)=$ $(5.94 \pm 0.06) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

⁴ALBRECHT 87D reports $(1.2\pm0.8) imes10^{-3}$ from a measurement of $[\Gamma(B^+\to$ $J/\psi(1S)~K^+\pi^+\pi^-)/\Gamma_{\mathsf{total}}]~\times~[\mathsf{B}(J/\psi(1S)~\to~e^+\,e^-)]$ assuming $\mathsf{B}(J/\psi(1S)~\to~e^+\,e^-)$ $e^+\,e^-)=$ 0.069 \pm 0.009, which we rescale to our best value B $(J/\psi(1S)
ightarrow\,e^+\,e^-)=$ $(5.94\pm0.06) imes 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. They actually report 0.0011 \pm 0.0007 assuming $B^+B^-/B^0\overline{B}^0$ ratio is 55/45. We rescale to 50/50. Analysis explicitly removes $B^+ \rightarrow \psi(2S) K^+$

 5 ALBRECHT $^{'}$ 90J reports $<~1.6~ imes~10^{-3}$ from a measurement of $[\Gamma(B^{+}~ o$ $J/\psi(1S)~K^+~\pi^+~\pi^-)/\Gamma_{ ext{total}}]~\times~[\mathrm{B}(J/\psi(1S)~\to~e^+~e^-)]$ assuming $\mathrm{B}(J/\psi(1S)~\to~e^+~e^-)$ $e^+e^-)=0.069$, which we rescale to our best value B $(J/\psi(1S)\to e^+e^-)=$ 5.94×10^{-2} . Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

| 1 LEES 111 reports $[\Gamma(B^+ \to \chi_c 0(1P)K^+)/\Gamma_{total}] \times [B(\chi_c 0(1P) \to \pi\pi)] = (1.53 \pm 0.66 \pm 0.27) \times 10^{-6}$ which we divide by our best value $B(\chi_c 0(1P) \to \pi\pi) = (8.5 \pm 0.4) \times 10^{-3}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. 2 Assumes equal production of B^+ and B^0 at the $T(4S)$. 3 AUBERT 08AI reports $(0.70 \pm 0.10^+0.12) \times 10^{-6}$ for $B(B^+ \to \chi_c 0 K^+) \times B(\chi_c 0 \to \pi^+\pi^-)$. We compute $B(B^+ \to \chi_c 0 K^+)$ using the PDG value $B(\chi_c 0 \to \pi\pi) = (8.5 \pm 0.4) \times 10^{-3}$ and $2/3$ for the $\pi^+\pi^-$ fraction. Our first error is their experiment's error and the second error is systematic error from using our best value. 4 Measured in the $B^+ \to K^+K^-K^+$ decay. 5 AUBERT, BE 06M reports $[\Gamma(B^+ \to \chi_c 0(1P) K^+)/\Gamma_{total}] \times [B(\chi_c 0(1P) \to \gamma J/\psi(1S))] = (6.1 \pm 2.6 \pm 1.1) \times 10^{-6}$ which we divide by our best value $B(\chi_c 0(1P) \to \gamma J/\psi(1S))] = (1.17 \pm 0.08) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. The significance of the observed signal is 2.4 σ. 6 WICHT 08 reports $[\Gamma(B^+ \to \chi_c 0(1P) K^+)/\Gamma_{total}] \times [B(\chi_c 0(1P) \to \gamma\gamma)] < 0.11 \times 10^{-6}$ which we divide by our best value $B(\chi_c 0(1P) \to \gamma\gamma)] < 0.11 \times 10^{-6}$ which we divide by our best value $B(\chi_c 0(1P) \to \gamma\gamma)] < 0.11 \times 10^{-6}$ which we divide by our best value $B(\chi_c 0(1P) \to \gamma\gamma)] < 0.11 \times 10^{-6}$ which we divide by our best value $B(\chi_c 0(1P) \to \gamma\gamma)] < 0.11 \times 10^{-6}$ which we divide by our best value $B(\chi_c 0(1P) \to \gamma\gamma)] < 0.11 \times 10^{-6}$ which we divide by our best value $B(\chi_c 0(1P) \to \gamma\gamma)] < 0.11 \times 10^{-6}$ which we divide by our best value $B(\chi_c 0(1P) \to \gamma\gamma)] < 0.11 \times 10^{-6}$ which we divide by our best value $B(\chi_c 0(1P) \to \gamma\gamma)] < 0.11 \times 10^{-6}$ which we divide by our best value $B(\chi_c 0(1P) \to \gamma\gamma)] < 0.11 \times 10^{-6}$ which we divide by our best value $B(\chi_c 0(1P) \to \gamma\gamma)] < 0.11 \times 10^{-6}$ which we divide by $B(\chi_c 0(1P) \to \gamma\gamma) = 0.11 \times 10^{-6}$ which we divide by $B(\chi_c 0(1P) \to \gamma\gamma) = 0.11 $ |

 1 Assumes equal production of B^0 and B^+ at the $\varUpsilon(4S);$ charm and charmonium contributions are subtracted, otherwise no assumptions about intermediate resonances.

 $^2\,\mathrm{ADA\,M}$ 96D assumes $f_{B^0}=f_{B^-}=0.39$ and $f_{B_S}=0.12$

 3 Assumes a B^0 , B^- production fraction of 0.39 and a $B_{\scriptscriptstyle S}$ production fraction of 0.12.

⁴ ALBRECHT 90B limit assumes equal production of $B^0 \overline{B}{}^0$ and $B^+ B^-$ at $\Upsilon(4S)$.

⁵ BORTOLETTO 89 reports $< 1.7 \times 10^{-4}$ assuming the $\Upsilon(4S)$ decays 43% to $B^0 \overline{B}{}^0$.

 1 Assumes equal production of B^+ and B^0 at the arphi(4S).

²ABE 00c assumes B(Z \rightarrow $b\,\overline{b}$)=(21.7 \pm 0.1)% and the B fractions $f_{B^0} = f_{B^+} =$ $(39.7 + 1.8 \atop -2.2)\%$ and $f_{B_s} = (10.5 + 1.8 \atop -2.2)\%$.

 $^3\mathrm{ADAM}$ 96D assumes $f_{B^0}=f_{B^-}=0.39$ and $f_{B_S}=0.12.$

 4 Assumes a B^0 , B^- production fraction of 0.39 and a $B_{\rm S}$ production fraction of 0.12.

⁵ Papers assume the $\Upsilon(4S)$ decays 43% to $B^0\overline{B}^0$. We rescale to 50%.

$$I(J^P) = \frac{1}{2}(0^-)$$

Quantum numbers not measured. Values shown are quark-model

See also the ${\it B}^{\pm}/{\it B}^{0}$ ADMIXTURE and ${\it B}^{\pm}/{\it B}^{0}/{\it B}_{\it S}^{\it 0}/\it b$ -baryon AD-MIXTURE sections.

See the Note "Production and Decay of b-flavored Hadrons" at the beginning of the \mathcal{B}^\pm Particle Listings and the Note on " \mathcal{B}^0 - $\overline{\mathcal{B}}^0$ Mixing" near the end of the \mathcal{B}^0 Particle Listings.

BO MASS

The fit uses $m_{B^+},\,(m_{B^0}-m_{B^+}),$ and m_{B^0} to determine $m_{B^+},\,m_{B^0},$ and the mass difference.

B⁰ MEAN LIFE

See $B^{\pm}/B^0/B_c^0/b$ -baryon ADMIXTURE section for data on B-hadron mean life averaged over species of bottom particles.

"OUR EVALUATION" is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFAG) and are described at http://www.slac.stanford.edu/xorg/hfag/. The averaging/rescaling procedure takes into account correlations between the measurements and asymmetric lifetime errors.

⁴ BEBEK 87 actually measure the difference between half of $E_{\rm cm}$ and the B^\pm or B^0 mass, so the $m_{B^0}-m_{B^\pm}$ is more accurate. Assume $m_{T(4S)}=10580$ MeV.

 $^{^2}$ Measured mean life using $B^0\to J/\psi\,K^{*0}$ decays. 3 Measured mean life using $B^0\to J/\psi\,K_{\rm S}$ decays.

 $^{^4}$ Measured using a simultaneous fit of the B^0 lifetime and $\overline{B}{}^0B^0$ oscillation frequency Δm_d in the partially reconstructed $B^0 \to D^{*-}\ell \nu$ decays.

⁵ Measurement performed using a combined fit of *CP*-violation, mixing and lifetimes.

 $^{^6}$ Measurement performed using an inclusive reconstruction and 8 flavor identification

⁷ AUBERT 03c uses a sample of approximately 14,000 exclusively reconstructed $B^0 \rightarrow$ $D^*(2010)^{-}\ell\nu$ and simultaneously measures the lifetime and oscillation frequency.

⁸ Measurement performed with decays $B^0 \to D^{*-}\pi^+$ and $B^0 \to D^{*-}\rho^+$ using a partial reconstruction technique. 9 Measured mean life using fully reconstructed decays. 10 Data analyzed using partially reconstructed $\overline{B}^0 \to D^{*+} \ell^- \overline{\nu}$ decays.

- $\frac{1}{\cdot}$ Measured mean life using fully reconstructed decays ($J/\psi \, {\it K}^{\left(*\right)})$
- $^2\,\mathrm{Data}$ analyzed using $D\,/\,D^*\,\mu\mathrm{X}$ vertices.
- ³ Measurement performed using a combined fit of *CP*-violation, mixing and lifetimes.
- 4 Measurement performed using an inclusive reconstruction and B flavor identification
- ⁵ Measured using fully reconstructed decays.
- 6 Events are selected in which one B meson is fully reconstructed while the second B meson is reconstructed inclusively.
- 7 Data analyzed using charge of secondary vertex. 8 ABREU 95Q assumes B(B 0 \rightarrow D^{**-} ℓ^+ ν_ℓ) = 3.2 \pm 1.7%.
- 9 Data analyzed using vertex-charge technique to tag B charge. 10 AKERS 95T assumes B($B^0\to D_{\rm S}^{~(*)}D^0(*))=5.0\pm0.9\%$ to find B^+/B^0 yield.
- 11 Combined result of $D/D^*\ell {\rm X}$ analysis and fully reconstructed ${\it B}$ analysis.

1.076±0.034 OUR EVALUATION

 au_{B^+}/ au_{B^0} (inferred from branching fractions)

These measurements are inferred from the branching fractions for semileptonic decay or other spectator-dominated decays by assuming that the rates for such decays are equal for B^0 and B^+ . We do not use measurements which assume equal production of B^0 and B^+ because of the large uncertainty in the production ratio.

"OUR EVALUATION" has been obtained by the Heavy Flavor Averaging Group (HFAG) by taking into account correlations between measurements DO CUMENT ID

- $D^{*+}\pi^-$, ρ^- decays to determine the flavor of the B meson. Assumes Δ_{md} =0.478 \pm 0.018 ps $^{-1}$ and τ_{B^0} =1.548 \pm 0.032 ps.

B⁰ DECAY MODES

 \overline{B}^0 modes are charge conjugates of the modes below. Reactions indicate the weak decay vertex and do not include mixing. Modes which do not identify the charge state of the B are listed in the B^\pm/B^0 ADMIXTURE

The branching fractions listed below assume 50% $B^0\,\overline B^0$ and 50% $B^+\,B^$ production at the $\Upsilon(4S)$. We have attempted to bring older measurements up to date by rescaling their assumed $\Upsilon(4S)$ production ratio to 50:50 and their assumed D, $D_{\rm S}$, D^* , and ψ branching ratios to current values whenever this would affect our averages and best limits significantly.

Indentation is used to indicate a subchannel of a previous reaction. All resonant subchannels have been corrected for resonance branching fractions to the final state so the sum of the subchannel branching fractions can exceed that of the final state.

For inclusive branching fractions, e.g., $B \rightarrow D^{\pm}$ anything, the values usually are multiplicities, not branching fractions. They can be greater

- [a] An ℓ indicates an e or a μ mode, not a sum over these modes.
- [b] \overline{D}^{**} represents an excited state with mass 2.2 < M < 2.8 GeV/c².
- $[c] X (3872)^+$ is a hypothetical charged partner of the X(3872).
- [d] Stands for the possible candidates of $K^*(1410)$, $K_0^*(1430)$ and $K_2^*(1430).$
- [e] ${\it B}^{0}$ and ${\it B}_{s}^{0}$ contributions not separated. Limit is on weighted average of the two decay rates.
- [f] This decay refers to the coherent sum of resonant and nonresonant ${\it J}^{\it P}$ = 0 $^+$ K π components with 1.60 < $m_{K\pi}$ < 2.15 GeV/c 2 .
- [g] X (214) is a hypothetical particle of mass 214 MeV/c² reported by the HyperCP experiment, Physical Review Letters 94 021801 (2005)
- [h] The value is for the sum of the charge states or particle/antiparticle states indicated.
- [i] $\Theta(1540)^+$ denotes a possible narrow pentaquark state.

CONSTRAINED FIT INFORMATION

An overall fit to 20 branching ratios uses 56 measurements and one constraint to determine 14 parameters. The overall fit has a $\chi^2=$ 37.3 for 43 degrees of freedom.

The following off-diagonal array elements are the correlation coefficients $\left<\delta x_i\delta x_j\right>/(\delta x_i\cdot\delta x_j)$, in percent, from the fit to the branching fractions, x_i \equiv $\Gamma_i/\Gamma_{
m total}$. The fit constrains the x_i whose labels appear in this array to sum to

- 1 URQUIJO 07 report a measurement of (9.80 \pm 0.29 \pm 0.21)% for the partial branching fraction of $B\to e\nu_e X_C$ decay with electron energy above 0.6 GeV. We converted the result to $B\to e\nu_e X$ branching fraction.
- $^2\, {\rm The\ measurements}$ are obtained for charged and neutral B mesons partial rates of semileptonic decay to electrons with momentum above 0.6 GeV/c in the B rest frame. The best precision on the ratio is achieved for a momentum threshold of 1.0 GeV: B($B^+
 ightharpoonup$ $e^{+} \nu_{e} X) / B(B^{0} \rightarrow e^{+} \nu_{e} X) = 1.074 \pm 0.041 \pm 0.026.$
- 3 ARTUSO 97 uses partial reconstruction of $B\to D^*\ell\nu_\ell$ and inclusive semileptonic branching ratio from BARISH 96B (0.1049 \pm 0.0017 \pm 0.0043).
- ⁴ The measurements are obtained for charged and neutral B mesons partial rates of semileptonic decay to electrons with momentum above 0.6 GeV/c in the B rest frame, and their ratio of B($B^+ \to e^+ \nu_e X$)/B($B^0 \to e^+ \nu_e X$) = 1.08 \pm 0.05 \pm 0.02.

- 1 Uses fully reconstructed $D^{*-}\,\ell^{+}\,\nu$ events $(\ell=e \text{ or }\mu).$
- 2 Uses a fully reconstructed B meson as a tag on the recoil side.
- 3 Measured using fully reconstructed D^* sample and a simultaneous fit to the Caprini-Lellouch-Neubert form factor parameters: $ho^2=1.191\pm0.048\pm0.028,\,R_1(1)=1.429\pm0.061\pm0.044,\,{\rm and}\,\,R_2(1)=0.827\pm0.038\pm0.022.$
- 4 Measured using fully reconstructed D^* sample
- ⁵ Uses the combined fit of both $B^0 \to D^*(2010)^- \ell \nu$ and $B^+ \to \overline{D}(2007)^0 \ell \nu$ samples.
- 6 ABREU 01H measured using about 5000 partial reconstructed D^* sample.
- ⁷ABBIENDI 00Q assumes the fraction B($b \rightarrow B^0$)= (39.7 $\frac{+1.8}{-2.2}$)%. This result is an average of two methods using exclusive and partial D^* reconstruction
- ⁸ BUSKULIC 97 assumes fraction $(B^+)=$ fraction $(B^0)=(37.8\pm2.2)\%$ and PDG 96 values for B lifetime and D^* and D branching fractions
- 9 Combines with previous partial reconstructed D^* measurement.
- 10 Assumes equal production of B^+ and B^0 at the $\varUpsilon(4S)$.
- $^{11}\,\mathrm{The}$ results are based on the same analysis and data sample reported in ADAM 03.
- 12 ACKERSTAFF 97G assumes fraction $(B^+)=$ fraction $(B^0)=(37.8\pm2.2)\%$ and PDG 96 values for B lifetime and branching ratio of D^st and D decays
- 13 ABREU 96P result is the average of two methods using exclusive and partial D^{st} reconstruction.
- ¹⁴ BARISH 95 use B($D^0 \to K^-\pi^+$) = (3.91 \pm 0.08 \pm 0.17)% and B($D^{*+} \to D^0\pi^+$) $= (68.1 \pm 1.0 \pm 1.3)\%.$
- 15 BUSKULIC 95N assumes fraction $(B^+)=$ fraction $(B^0)=38.2\pm1.3\pm2.2\%$ and au_{R^0} $= 1.58 \pm 0.06$ ps. $\Gamma(D^{*-}\ell^{+}\nu_{\ell})/{
 m total} = [5.18 - 0.13({
 m fraction}(B^{0}) - 38.2) - 1.5(au_{B^{0}} - 2.18) + 1.5(1.8)$
- ¹⁶ ALBRECHT 94 assumes B($D^{*+} \rightarrow D^0 \pi^+$) = 68.1 \pm 1.0 \pm 1.3%. Uses partial reconstruction of D^{*+} and is independent of D^{0} branching ratios.
- TALBREATH 93 reports $0.052 \pm 0.005 \pm 0.006$. We rescale using the method described in STONE 94 but with the updated PDG 94 B($D^0 \rightarrow K^-\pi^+$). We have taken their average e and μ value. They also obtain $\alpha = 2*F^0/(\Gamma^- + \Gamma^+) 1 = 1.1 \pm 0.4 \pm 0.2$. $A_{AF}=3/4*(\Gamma^--\Gamma^+)/\Gamma=0.2\pm0.08\pm0.06$ and a value of $|V_{cb}|=0.036$ –0.045 depending on model assumptions.
- 18 Combining $\overline{D}^{*0}\ell^+\nu_\ell$ and $\overline{D}^{*-}\ell^+\nu_\ell$ SANGHERA 93 test V-A structure and fit the decay angular distributions to obtain $A_{FB}=3/4*(\Gamma^--\Gamma^+)/\Gamma=0.14\pm0.06\pm0.03$. Assuming a value of V_{CD} , they measure V_c , A_1 , and A_2 , the three form factors for the $D^*\ell
 u_\ell$ decay, where results are slightly dependent on model assumptions.
- 19 A NTREASYA N 90B is average over B and $\overline{D}^*(2010)$ charge states.
- 20 The measurement of ALBRECHT 89c suggests a D^* polarization γ_L/γ_T of 0.85 \pm 0.45. or $\alpha=0.7\pm0.9$.
- 21 ALBRECHT 89) is ALBRECHT 87) value rescaled using B($D^*(2010)^- \rightarrow D^0\pi^-$) = 0.57 \pm 0.04 \pm 0.04. Superseded by ALBRECHT 93.
- $0.57 \pm 0.04 \pm 0.04$. Supersected by ALDRECH 1 93. 22 We have taken average of the the BORTOLETTO 89B values for electrons and muons, $0.046 \pm 0.005 \pm 0.007$. We rescale using the method described in STONE 94 but with the updated PDG 94 B($D^0 \rightarrow K^-\pi^+$). The measurement suggests a D^* polarization parameter value $\alpha = 0.65 \pm 0.66 \pm 0.25$.
- 23 ALBRECHT 87J assume μ -e universality, the B($\varUpsilon(4S)
 ightarrow ~B^0 \, \overline{B}{}^0$) = 0.45, the B($D^0
 ightarrow$ $(K^-\pi^+)=(0.042\pm 0.004\pm 0.004)$, and the $B(D^*(2010)^-\to D^0\pi^-)=0.49\pm 0.08$. Superseded by ALBRECHT 891.

 $^{1}\mathit{B}^{+}$ and B^{0} decays combined assuming isospin symmetry. Systematic errors include both

experimental and form-factor uncertainties. 2 The B^0 and B^+ results are combined assuming the isospin, B lifetimes, and relative charged/neutral B production at the $\Upsilon(4S)$.

 $^3\,\mathrm{The\ signal\ events}$ are tagged by a second B meson reconstructed in the semileptonic mode $B \to D^{(*)} \ell \nu_{\ell}$.

ATHAR 03 reports systematic errors $^{+0.47}_{-0.50}$ \pm 0.41 \pm 0.01, which are experimental systematic, systematic due to residual form-factor uncertainties in the signal, and systematic tematic due to residual form-factor uncertainties in the cross-feed modes, respectively. We combine these in quadrature.

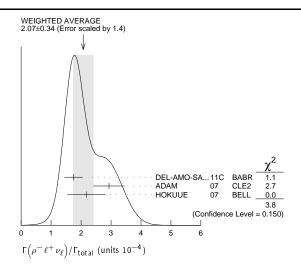

5 Uses isospin constraints and extrapolation to all electron energies according to five different form-factor calculations. The second error combines the systematic and theoretical uncertainties in quadrature.

⁶ Averaging with ALEXANDER 96T results including experimental and theoretical correlations considered, BEHRENS 00 reports systematic errors $^{+}_{-0.46}^{+0.33}\pm$ 0.41, where the

second error is theoretical model dependence. We combine these in quadrature. 7 BEHRENS 00 reports $^{+0.35}_{-0.40}\pm$ 0.50, where the second error is the theoretical model dependence. We combine these in quadrature. B^+ and B^0 decays combined using isospin symmetry: $\Gamma(B^0\to\rho^-\ell^+\nu)=2\Gamma(B^+\to\rho^0\ell^+\nu)\approx 2\Gamma(B^+\to\omega\ell^+\nu)$. No

isospin symmetry. If $\nu = \nu$ = 7, evidence for $\omega \ell \nu$ is reported. 8 ALEXANDER 96T reports $^{+0.5}_{-0.7} \pm 0.5$ where the second error is the theoretical model $^{+0.5}_{-0.7} \pm 0.5$ where the second error is the theoretical model $^{+0.5}_{-0.7} \pm 0.5$ where the second error is the theoretical model $^{+0.5}_{-0.7} \pm 0.5$ where the second error is the theoretical model $^{+0.5}_{-0.7} \pm 0.5$ where the second error is the theoretical model $^{+0.5}_{-0.7} \pm 0.5$ where the second error is the theoretical model $^{+0.5}_{-0.7} \pm 0.5$ where the second error is the theoretical model $^{+0.5}_{-0.7} \pm 0.5$ where the second error is the theoretical model $^{+0.5}_{-0.7} \pm 0.5$ where the second error is the theoretical model $^{+0.5}_{-0.7} \pm 0.5$ where $^{+0.5}_{-0.7} \pm 0.5$ decays combined using dependence. We combine these in quadrature. B^+ and B^0 decays combined using isospin symmetry: $\Gamma(B^0\to\rho^-\ell^+\nu)=2\Gamma(B^+\to\rho^0\ell^+\nu)\approx 2\Gamma(B^+\to\nu\ell^+\nu)$. No evidence for $\omega\ell\nu$ is reported.

⁹BEAN 93B limit set using ISGW Model. Using isospin and the quark model to combine $\Gamma(
ho^0\ell^+\nu_\ell)$ and $\Gamma(\omega\ell^+\nu_\ell)$ with this result, they obtain a limit <(1.6–2.7) \times 10⁻⁴ at 90% CL for $B^+ \to (\omega \text{ or } \rho^0) \ell^+ \nu_\ell$. The range corresponds to the ISGW, WSB, and KS models. An upper limit on $\left|V_{ub}/V_{cb}\right| <$ 0.08–0.13 at 90% CL is derived as well.

 $\Gamma(\pi^-\ell^+\nu_\ell)/\Gamma_{ ext{total}}$ "OUR EVALUATION" is provided by the Heavy Flavor Averaging Group (HFAG) the procedure is described at http://www.slac.stanford.edu/xorg/hfag/

 $^{\rm 1}\,{\rm Using}$ isospin relation, ${\it B}^{\,+}$ and ${\it B}^{\,0}$ branching fractions are combined

Uses the neutrino reconstruction technique. Assumes $B(\Upsilon(4S) \to B^+B^-) = (51.6 \pm 0.6)\%$ and $B(\Upsilon(4S) \to B^0\overline{B}^0) = (48.4 \pm 0.6)\%$. ³ The B^0 and B^+ results are combined assuming the isospin, B lifetimes, and relative charged/neutral B production at the $\Upsilon(4S)$.

⁴ Also report the rate for $q^2 > 16$ GeV² of $(0.41 \pm 0.08 \pm 0.04) \times 10^{-4}$ from which they obtain $|V_{ub}|=3.6\pm0.4\pm0.2^{+0.6}_{-0.4}$ (last error is from theory).

 $^{5}\,\mathrm{The}$ signal events are tagged by a second B meson reconstructed in the semileptonic mode $B \to D^{(*)} \ell \nu_{\ell}$.

⁶ The analysis uses events in which the signal B decays are reconstructed with an innovative loose neutrino reconstruction technique.

The signals are tagged by a second B meson reconstructed in a semileptonic or hadronic decay. The B^0 and B^+ results are combined assuming the isospin symmetry.

 $^8B^+$ and 0 decays combined assuming isospin symmetry. Systematic errors include both experimental and form-factor uncertainties.

PATHAR 03 reports systematic errors $0.11\pm0.01\pm0.07$, which are experimental systematic, systematic due to residual form-factor uncertainties in the signal, and systematic due to residual form-factor uncertainties in the cross-feed modes, respectively. We combine these in quadrature.

 10 ALEXA NDER 96T gives systematic errors $\pm 0.3\pm 0.2$ where the second error reflects the estimated model dependence. We combine these in quadrature. Assumes isospin symmetry: $\Gamma(B^0\to\pi^-\ell^+\nu)=2\times\Gamma(B^+\to\pi^0\ell^+\nu)$.

 1 ALAM 94 value is twice their $\Gamma(D^*(2010)^-\pi^+\pi^+\pi^-)/\Gamma_{\rm total}$ value based on their observation that the three pions are dominantly in the $a_1(1260)$ mass range 1.0 to 1.6 . GeV.

 2 ALAM 94 assume equal production of B^+ and B^0 at the $\varUpsilon(4S)$ and use the CLEOII B($D^*(2010)^+ \to D^0 \, \pi^+$) and absolute B($D^0 \to K^- \pi^+$) and the PDG 1992 B($D^0 \to K^- \pi^+ \pi^+)$)/B($D^0 \to K^- \pi^+$) and B($D^0 \to K^- \pi^+ \pi^-)$ /B($D^0 \to K^- \pi^+$). 3 BORTOLETTO 92 reports 0.018 \pm 0.006 \pm 0.006 from a measurement of $[\Gamma(B^0 \to D^*(2010)^- a_1(1260)^+)/\Gamma_{\rm total}] \times [B(D^*(2010)^+ \to D^0 \pi^+)]$ assuming B($D^*(2010)^+ \to D^0 \pi^+$) = 0.57 \pm 0.06, which we rescale to our best value B($D^*(2010)^+ \to D^0 \pi^+$) = (67.7 \pm 0.5) \times 10^{-2}. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes

equal production of B^+ and B^0 at the arphi(4S) and uses MarkIII branching fractions for

 1 Assumes equal production of B^+ and B^0 at the $\varUpsilon(4S).$ The signal is consistent with all observed $\omega\pi^+$ having proceeded through the ρ'^+ resonance at mass 1349 \pm 25 $^{+10}_{-5}$ MeV and width 547 \pm 86 $^{+46}_{-45}$ MeV.

^2ALBRECHT 90J reports 0.041 \pm 0.015 \pm 0.016 from a measurement of [$\Gamma(B^0 \to D^*(2010)^-\pi^+\pi^+\pi^-\pi^0)/\Gamma_{total}$] \times [$B(D^*(2010)^+ \to D^0\pi^+)$] assuming $B(D^*(2010)^+ \to D^0\pi^+) = 0.57 \pm 0.06$, which we rescale to our best value $B(D^*(2010)^+ \to D^0\pi^+) = (67.7 \pm 0.5) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of B^+ and B^0 at the $\Gamma(4S)$ and uses Mark III branching fractions for the Γ

 1 Assumes equal production of B^+ and B^0 at the \varUpsilon (4S).

 $^{-1}$ Assumes equal production of B^{+} and B^{0} at the $\Upsilon(4S)$.

²The signal is consistent with all observed $\omega\pi^+$ having proceeded through the ρ'^+ resonance at mass 1349 \pm 25 $^{+10}_{-5}$ MeV and width 547 \pm 86 $^{+46}_{-45}$ MeV.

$$\frac{\Gamma(D_1(2430)^0 \omega \times B(D_1(2430)^0 \to D^{*-}\pi^+))/\Gamma_{total}}{A.1 \pm 1.2 \pm 1.1} \frac{DOCUMENT\ ID}{1\ AUBERT} \frac{TECN}{06L} \frac{COMMENT}{e^+e^- \to \Upsilon(4S)}$$

 1 Obtained by fitting the events with cos $\theta_{D^*} < 0.5$ and scaling up the result by a factor of 4/3. No interference effects between $B^0 \to D_1' \omega$ and $D^* \omega \pi$ are assumed.

AUBERT.BE 06J reports $[\Gamma(B^0 \to D^{**-}\pi^+)/\Gamma_{\rm total}]/[B(B^0 \to D^-\pi^+)] = 0.77 \pm 0.22 \pm 0.29$ which we multiply by our best value $B(B^0 \to D^-\pi^+) = (2.68 \pm 0.13) \times 10^{-3}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

eviation from some discontinuous value. 2 Uses a missing-mass method. Does not depend on D branching fractions or B^+/B^0 production rates.

 $^{^1}$ Assumes equal production of B^+ and $B^{\,0}$ at the $\, \varUpsilon$ (45).

¹ AUBERT 07AV reports $[\Gamma(B^0 \to J/\psi(1S) K^*(892)^0)/\Gamma_{total}] \times [B(J/\psi(1S) \to p\overline{p})]$ = $(2.82 + 0.30 + 0.36) \times 10^{-6}$ which we divide by our best value B $(J/\psi(1S) \rightarrow p\overline{p}) =$ $(2.17\pm0.07)\times10^{-3}$. Our first error is their experiment's error and our second error is

the systematic error from using our best value. ² Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

ABE 980 reports $[B(B^0 \to J/\psi(1S)~K^*(892)^0]]/[B(B^+ \to J/\psi(1S)~K^+)] = 1.76 \pm 0.14 \pm 0.15$. We multiply by our best value $B(B^+ \to J/\psi(1S)~K^+) = (9.9 \pm 1.0) \times 10^{-4}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

 5 BORTOLETTO 92 reports (1.1 \pm 0.5 \pm 0.3) $\times 10^{-3}$ from a measurement of [Г(B 0 \rightarrow $\textit{J/}\psi(1\textit{S})\;\textit{K*}(892)^{\textstyle 0})/\Gamma_{\textstyle \text{total}}]\;\times\; [\textit{B}(\textit{J/}\psi(1\textit{S})\;\rightarrow\;\;e^{+}\,e^{-})]\;\; \text{assuming}\;\; \textit{B}(\textit{J/}\psi(1\textit{S})\;\rightarrow\;\;e^{+}\,e^{-})]$ $e^+\,e^-)=$ 0.069 \pm 0.009, which we rescale to our best value B $(J/\psi(1S)
ightarrow\,e^+\,e^-)=$ $(5.94 \pm 0.06) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

 6 ALBRECHT 9 0J reports $(1.1\pm0.5\pm0.2) imes10^{-3}$ from a measurement of $[\Gamma(B^0
ightarrow$ $J/\psi(1S)~K^*(892)^0)/\Gamma_{ ext{total}}]~\times~[\mathrm{B}(J/\psi(1S)~\to~e^+\,e^-)]$ assuming $\mathrm{B}(J/\psi(1S)~\to~e^+\,e^-)$ $e^+\,e^-)=$ 0.069 \pm 0.009, which we rescale to our best value B $(J/\psi(1S)
ightarrow\,e^+\,e^-)=$ $(5.94 \pm 0.06) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

 7 BEBEK 87 reports (3.5 \pm 1.6 \pm 0.3) imes 10 $^{-3}$ from a measurement of [$\Gamma(B^0
ightarrow$ $J/\psi(1S)~K^*(892)^0)/\Gamma_{ ext{total}}]~\times~[B(J/\psi(1S)~\to~e^+\,e^-)]$ assuming $B(J/\psi(1S)~\to~e^+\,e^-)$ $e^+e^-)=0.069\pm0.009$, which we rescale to our best value B $(J/\psi(1S)\to e^+e^-)=$ $(5.94 \pm 0.06) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Updated in BORTOLETTO 92 to use the same assumptions.

⁸ ABE 96H assumes that B($B^+ \to J/\psi K^+$) = (1.02 ± 0.14) × 10⁻³.

⁹ The neutral and charged B events together are predominantly longitudinally polarized, $\Gamma_L/\Gamma=0.080\pm0.08\pm0.05$. This can be compared with a prediction using HQET, 0.73 (KRAMER 92). This polarization indicates that the $B \to \, \psi \, K^*$ decay is dominated by the $\mathit{CP} = -1$ CP eigenstate. Assumes equal production of B^+ and B^0 at the $\varUpsilon(4\mathit{S})$.

 $^{
m 10}$ ALBRECHT 94G measures the polarization in the vector-vector decay to be predominantly longitudinal, $\Gamma_{\slash\hspace{-0.4em}T}/\Gamma=0.03\pm0.16\pm0.15$ making the neutral decay a $\it CP$ eigenstate when the K^{*0} decays through $K_S^0 \pi^0$

¹¹ ALBAJAR 91E assumes B_d^0 production fraction of 36%.

 12 ALBRECHT 87D assume $B^+B^-/B^0\overline{B}^0$ ratio is 55 /45. Superseded by ALBRECHT 90J. 13 ALAM 86 assumes B^{\pm}/B^0 ratio is 60/40. The observation of the decay $B^+ \rightarrow$ $J/\psi\, K^*(892)^+$ (HAAS 85) has been retracted in this paper.
