Tabla de contenido

1) OBJETIVOS DEL ESTUDIO

El estudio tiene como objetivo esencial calcular el Factor de Impacto con una ventana de citación de 5 años (IF5^{2011}) de 335 congresos de informática de diferentes especialidades. El cálculo del Factor de Impacto corresponde al año 2011. Una vez computado dicho indicador se pone en relación con el IF5 de diferentes revistas científicas indexadas en las áreas de Computer Science del Journal Citation Reports de Thomson Reuters. De esta forma se podrá observar por un lado el impacto científico de los congresos y por otro si dicho impacto es equiparable al de las revistas científicas.

Este informe está formado por dos secciones principales, la Introducción, donde se describe la metodología que se ha seguido para seleccionar los congresos y calcular su IF5^{2011}, así como el método utilizado para seleccionar las revistas con las que se han comparado. A continuación se presentan los resultados mediante dos rankings a) uno de congresos ordenados según el IF5^{2011} con una equivalencia decílica a las revistas del JCR y b) un ranking conjunto de congresos y revistas ordenada según el valor de IF5^{2011}. Anexo a este documento se adjuntan materiales complementarios que contienen todos los datos que han sido necesarios para calcular el IF5^{2011}.

2) METODOLOGÍA

2.1) Cálculo del Factor de Impacto con ventana de citación de cinco años para el año 2011 - IF5^{2011}

En este trabajo se ofrece como indicador de impacto para el año 2011, el Factor de Impacto clásico pero empleando una ventana de citación de cinco años (IF5^{2011}). Se ha seguido la fórmula empleada tradicionalmente en bibliometría por Eugene Garfield y que se ofrece en los productos del Journal Citation Reports. Se ha decidido calcular el Factor de Impacto a 5 años debido principalmente a que hay congresos bianuales a los que podría perjudicar el factor de impacto tradicional (con una ventana de citación de dos años), y también porque una ventana de citación de cinco años da mayor estabilidad al indicador. Concretamente, la fórmula utilizada es la siguiente:

$$IF5^{2011} = \frac{Citas\ recibidas\ en\ 2011\ por\ los\ trabajos\ publicados\ en\ 2010,2009,2008,2007\ y\ 2006}{Trabajos\ publicados\ durante\ los\ años\ 2010,2009,2008,2007\ y\ 2006}$$

2.2) Fuente de Información para la recopilación de las citas: Scopus de Elsevier

Como fuente de información se ha utilizado la base de datos de Scopus de Elsevier tanto para la recopilación del número de trabajos (Conference Papers) de cada congreso como para la recopilación del número de citas recibidas por dichos trabajos. Se seleccionó esta base de datos al tener una mayor cobertura de la literatura científica ya que actualmente indexa 18.500 revistas científicas; incluyen además 4,4 millones de conference papers, 1.2 millones de esos papers fueron publicados en revistas científicas y 3.3 millones fueron publicados en conference proceedings. Precisamente el área de Computer Science es una de la mejor cubierta, el 62% de los trabajos indexados en el área se corresponden a conference papers y el 32% a trabajos publicados en revistas. Por tanto Scopus presenta una buena cobertura de los proceedings en informática muy por encima de otras áreas como la ingeniería que tiene solo un 45%.

2.3) Selección de los congresos a estudiar

Para este estudio se ha seleccionado una muestra de congresos de informática elaborada a partir de dos fuentes de información:

1) El listado de congresos elaborados en la *ERA Conference Ranking Exercise* por la *Computing Research in Education* (Australia) y conocidos en la comunidad científica como listados CORE. Hay que reseñar que del listado CORE no se seleccionaron todos los congresos sino solo aquellos clasificados con la letra A y por tanto aquellos considerados como los más prestigiosos; el total de congresos seleccionados del CORE A fue de 256 (Tabla 1).

Tabla 1. *Número de congresos seleccionados de los listados CORE clasificados como A distribuidos por materias*

Computer Software	52	Computer Hardware	14
Artificial Intelligence and Image Processing	48	Communications Technologies	13
Computation Theory and Mathematics	39	Other Information and Computing Sciences	3
Distributed Computing	29	Information and Computing Sciences	2

Data Format	25	Manufacturing Engineering	1

2) El 35% de los congresos con mayor número de citas indexados en *Microsoft Academic Search – Conferences – Top Conferences in Computer Science* a fecha de Enero de 2012. El total de congresos seleccionados de esta fuente fue de 204 congresos

.

.

Una vez que se eliminaron los congresos presentes en ambas fuentes el total de congresos fue de 335. En cuanto a la periodicidad de los congresos seleccionados como se puede observar en la Tabla 2 la mayor parte de los congresos estudiados son de carácter anual, un 79%. En un 11% de los casos no se ha podido determinar su periodicidad bien porque tienen un carácter irregular en su celebración o bien porque no ha podido identificar dicho dato.

Tabla 2. *Congresos estudiados según su periodicidad*

Anual	264	79%
Bianual	34	10%
Sin determinar	37	11%

2.4) Localización de los congresos en la base de datos Scopus y recuperación del número de citas

Una vez identificados los congresos a estudiar se procedió a su identificación en Scopus y a la descarga de su producción y de las citas recibidas por los mismos. Para llevar a cabo la búsqueda de los congresos en Scopus, se formuló una ecuación de búsqueda ad-hoc para cada uno de los congresos siempre teniendo en cuenta en su definición los problemas de normalización que tienen la denominación de los congresos en Scopus (por ejemplo con los acrónimos de los congresos). Las ecuaciones diseñadas por tanto para cada congreso constaban del nombre del congreso, sus siglas, y los años de producción que se querían recuperar. Dichas ecuaciones se lanzaban contra los campos 'Conference' y 'Source Title', a continuación mostramos un ejemplo:

(SRCTITLE ("Virtual Reality Software and Technology" AND vrst) OR CONF ("Virtual Reality Software and Technology" AND vrst)) AND PUBYEAR > 2005 ANDPUBYEAR < 2012

Los resultados de esta búsqueda se contrastaban en la '*DBLP Computer Science Bibliography*' para comprobar si los años en los que Scopus no devolvía información realmente se habían celebrado una edición del congreso. Finalmente, se comprobaba que no se incluyeran en los resultados publicaciones que no pertenecieran al congreso, y si esto sucedía se eliminaban los resultados no pertinentes. Una vez realizada la búsqueda e identificada la producción, los datos de publicación de cada congreso se extrajeron directamente de la interfaz web de Scopus. A continuación se procedió a descargar la referencia completa de los trabajos que habían citado a los congresos de manera que se pudiera reconstruir una matriz de citación que nos permitiera calcular el Factor de Impacto a cinco años definido en el apartado 2.1.

Evidentemente de dicha matriz solo se extrajo el número de citas emitidas en 2011 a los trabajos publicados entre 2006-2010. El resto de citas no se tuvieron en cuenta ya que no entran dentro del rango de la ventana de citación. Ejemplo de los datos recopilados para el congreso *IEEE Visualization* y cálculo del IF5^{2011}

2.5) Selección de las revistas para la comparativa

Para contextualizar los datos del impacto científico de los congresos según su IF5^{2011} y conocer en cierta medida su equivalencia con el impacto de las revistas científicas se seleccionó una muestra de revistas extraída del *Journal Citation Reports* en su edición *Science* de 2011 (Thomson Reuters). Concretamente se tomaron las siete categorías de *Computer Science* que aparecen en el *Journal Citation Report* (Tabla 3) y a continuación cada una estas áreas se ordenaron por su *Impact Factor* (IF) seleccionándose aquellas revistas con mayor IF de cada decil de manera que se tuviera una representación de revistas con diferentes valores de IF. En total la muestra de revista escogidas fue de 10 revistas por categoría JCR, sumando por tanto la muestra final un total de 70 revistas científicas.

Tabla 3. *Categorías del JCR relacionadas en Computer Science. Para cada una de ellas se ha extraído las revistas que marcan el comienzo de cada decil según el Impact Factor de Thomson Reuters de 2011*

A continuación para conseguir un IF de cinco años equivalente al calculado para los congresos se buscó en la base de datos Scopus la producción y citación de las revistas seleccionadas siguiendo el mismo método que se describe en el apartado 2.4. Finalmente se obtuvo para cada una de las 7 categorías JCR un listado de 10 revistas ordenadas según su IF5^{2011} (Scopus) y se añadió a cada revista una etiqueta de decil que será a la postre la empleada en la diferentes comparativas que se muestran en este trabajo (Tabla 4).

3) MATERIAL COMPLEMENTARIO

Este documento se complementa con un fichero excel con el siguiente contenido:

● CONGRESOS. Datos bibliográficos. En esta hoja se ofrecen los datos identificativos de los congresos y las observaciones y ecuaciones de búsqueda empleadas durante el proceso de búsqueda en la bases de datos Scopus.

● CONGRESOS. Datos bibliométricos. En esta hoja se ofrecen los datos bibliométricos de los congresos. En la misma se desglosan los datos de trabajos de forma anual, asimismo se presentan los datos que permite reconstruir la matriz de citación de cada congreso.

● REVISTAS. Datos completos. En esta se encuetra las revistas utilizadas en la comparativa. Se ofrece que revistas se han seleccionado para cada una de las revistas de Computer Science y al igual que para los congresos se ofrece el desglose de los datos bibliográficos y biblioetricos.
