

Masonry buildings

Reinforced buildings

Classification of damages

Grade 1: Negligible to slight damage
(no structural damage, slight non-structural damage)

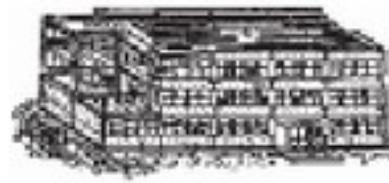

Grade 2: Moderate damage
(slight structural damage,
moderate non-structural damage)

Grade 3: Substantial to heavy damage (moderate structural damage, heavy non-structural damage)

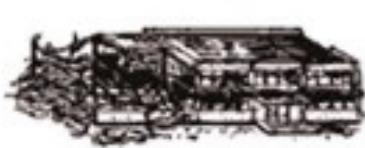

Grade 4: Very heavy damage
(heavy structural damage,
very heavy non-structural damage)

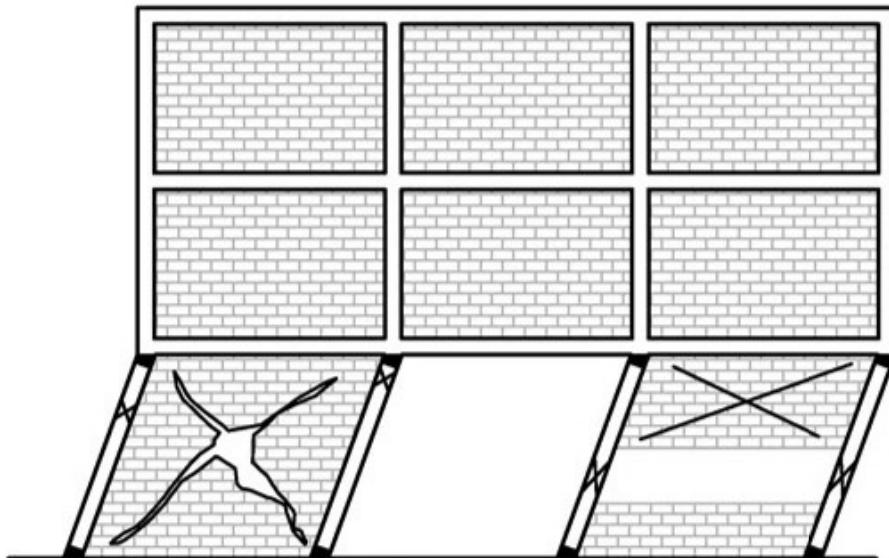

Grade 5: Destruction
(very heavy structural damage)

Brittle concrete column

Cracks form in both concrete columns. In the poorly reinforced column at left, concrete chunks begin to fall. The well-reinforced column remains intact.

Stronger concrete column

The brittle column begins to collapse as more chunks of concrete fall. Interlaced steel reinforcing bars hold the concrete in place in the strong column.

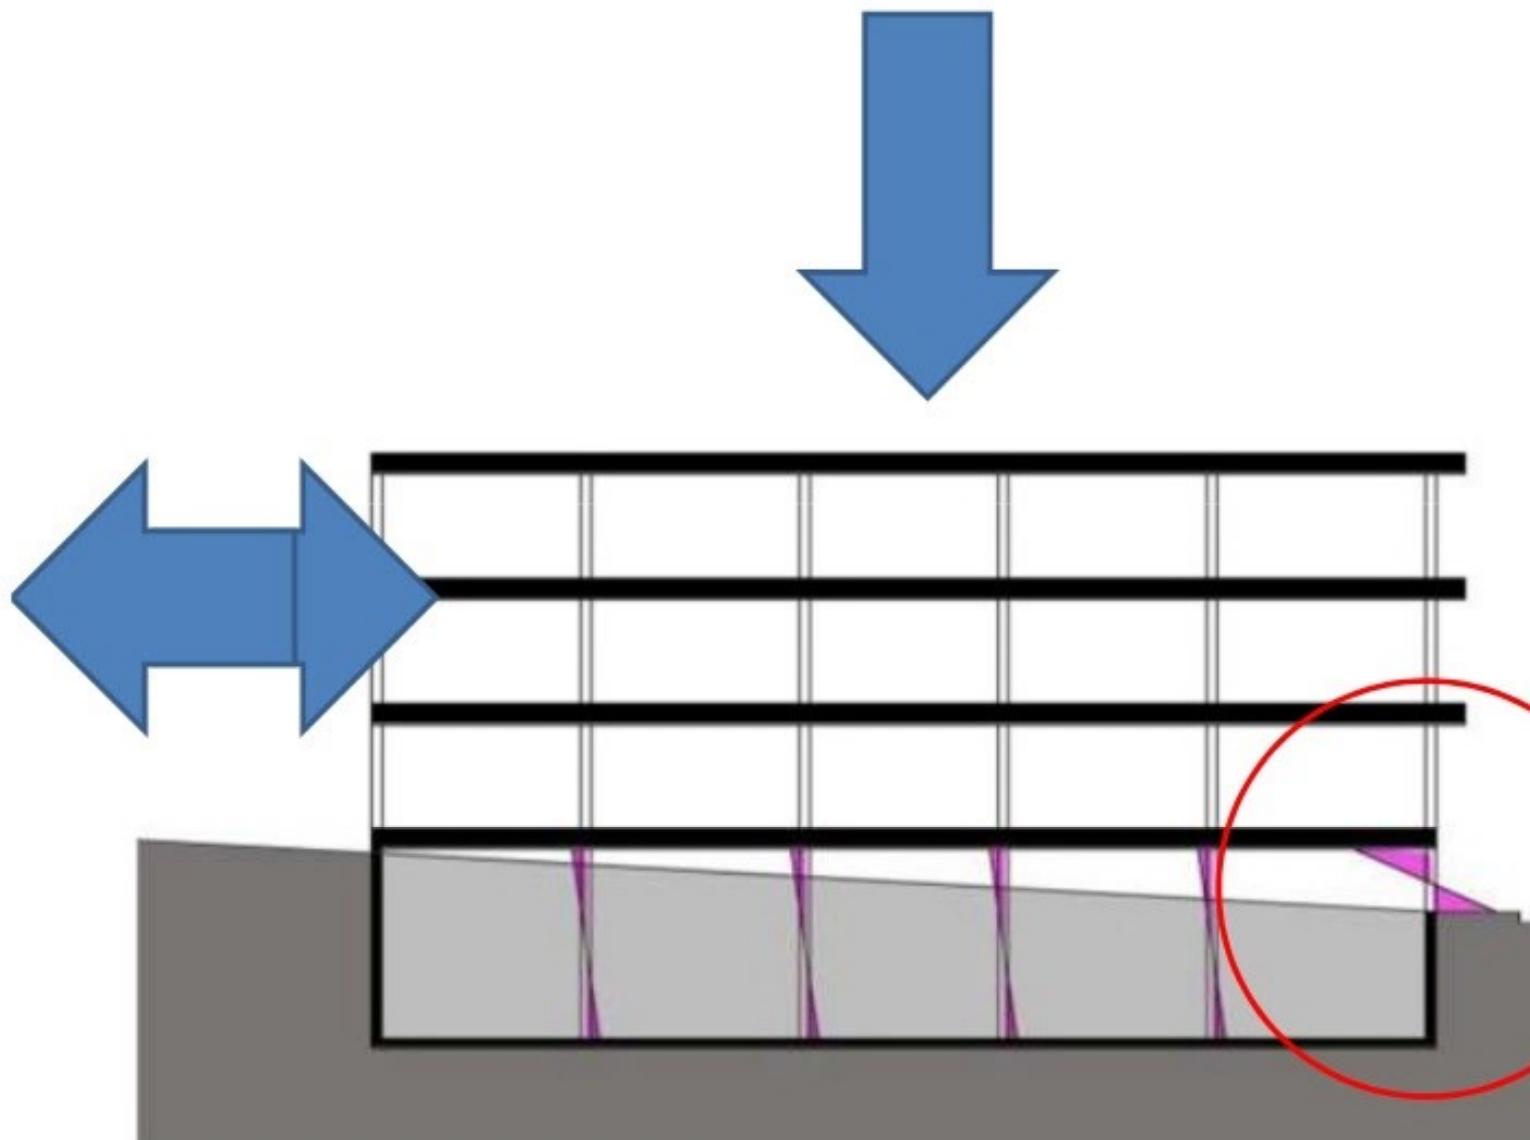

The weight of the building deforms the steel bars of the weak column, allowing the remaining concrete to explode out. The well-reinforced column bends sideways but retains its strength.

As weak columns fail throughout the building, occupants can be buried under tons of concrete. Strong columns may suffer some damage but still hold up the building's weight.

MECANISMOS BÁSICOS

OUT-OF-PLANE

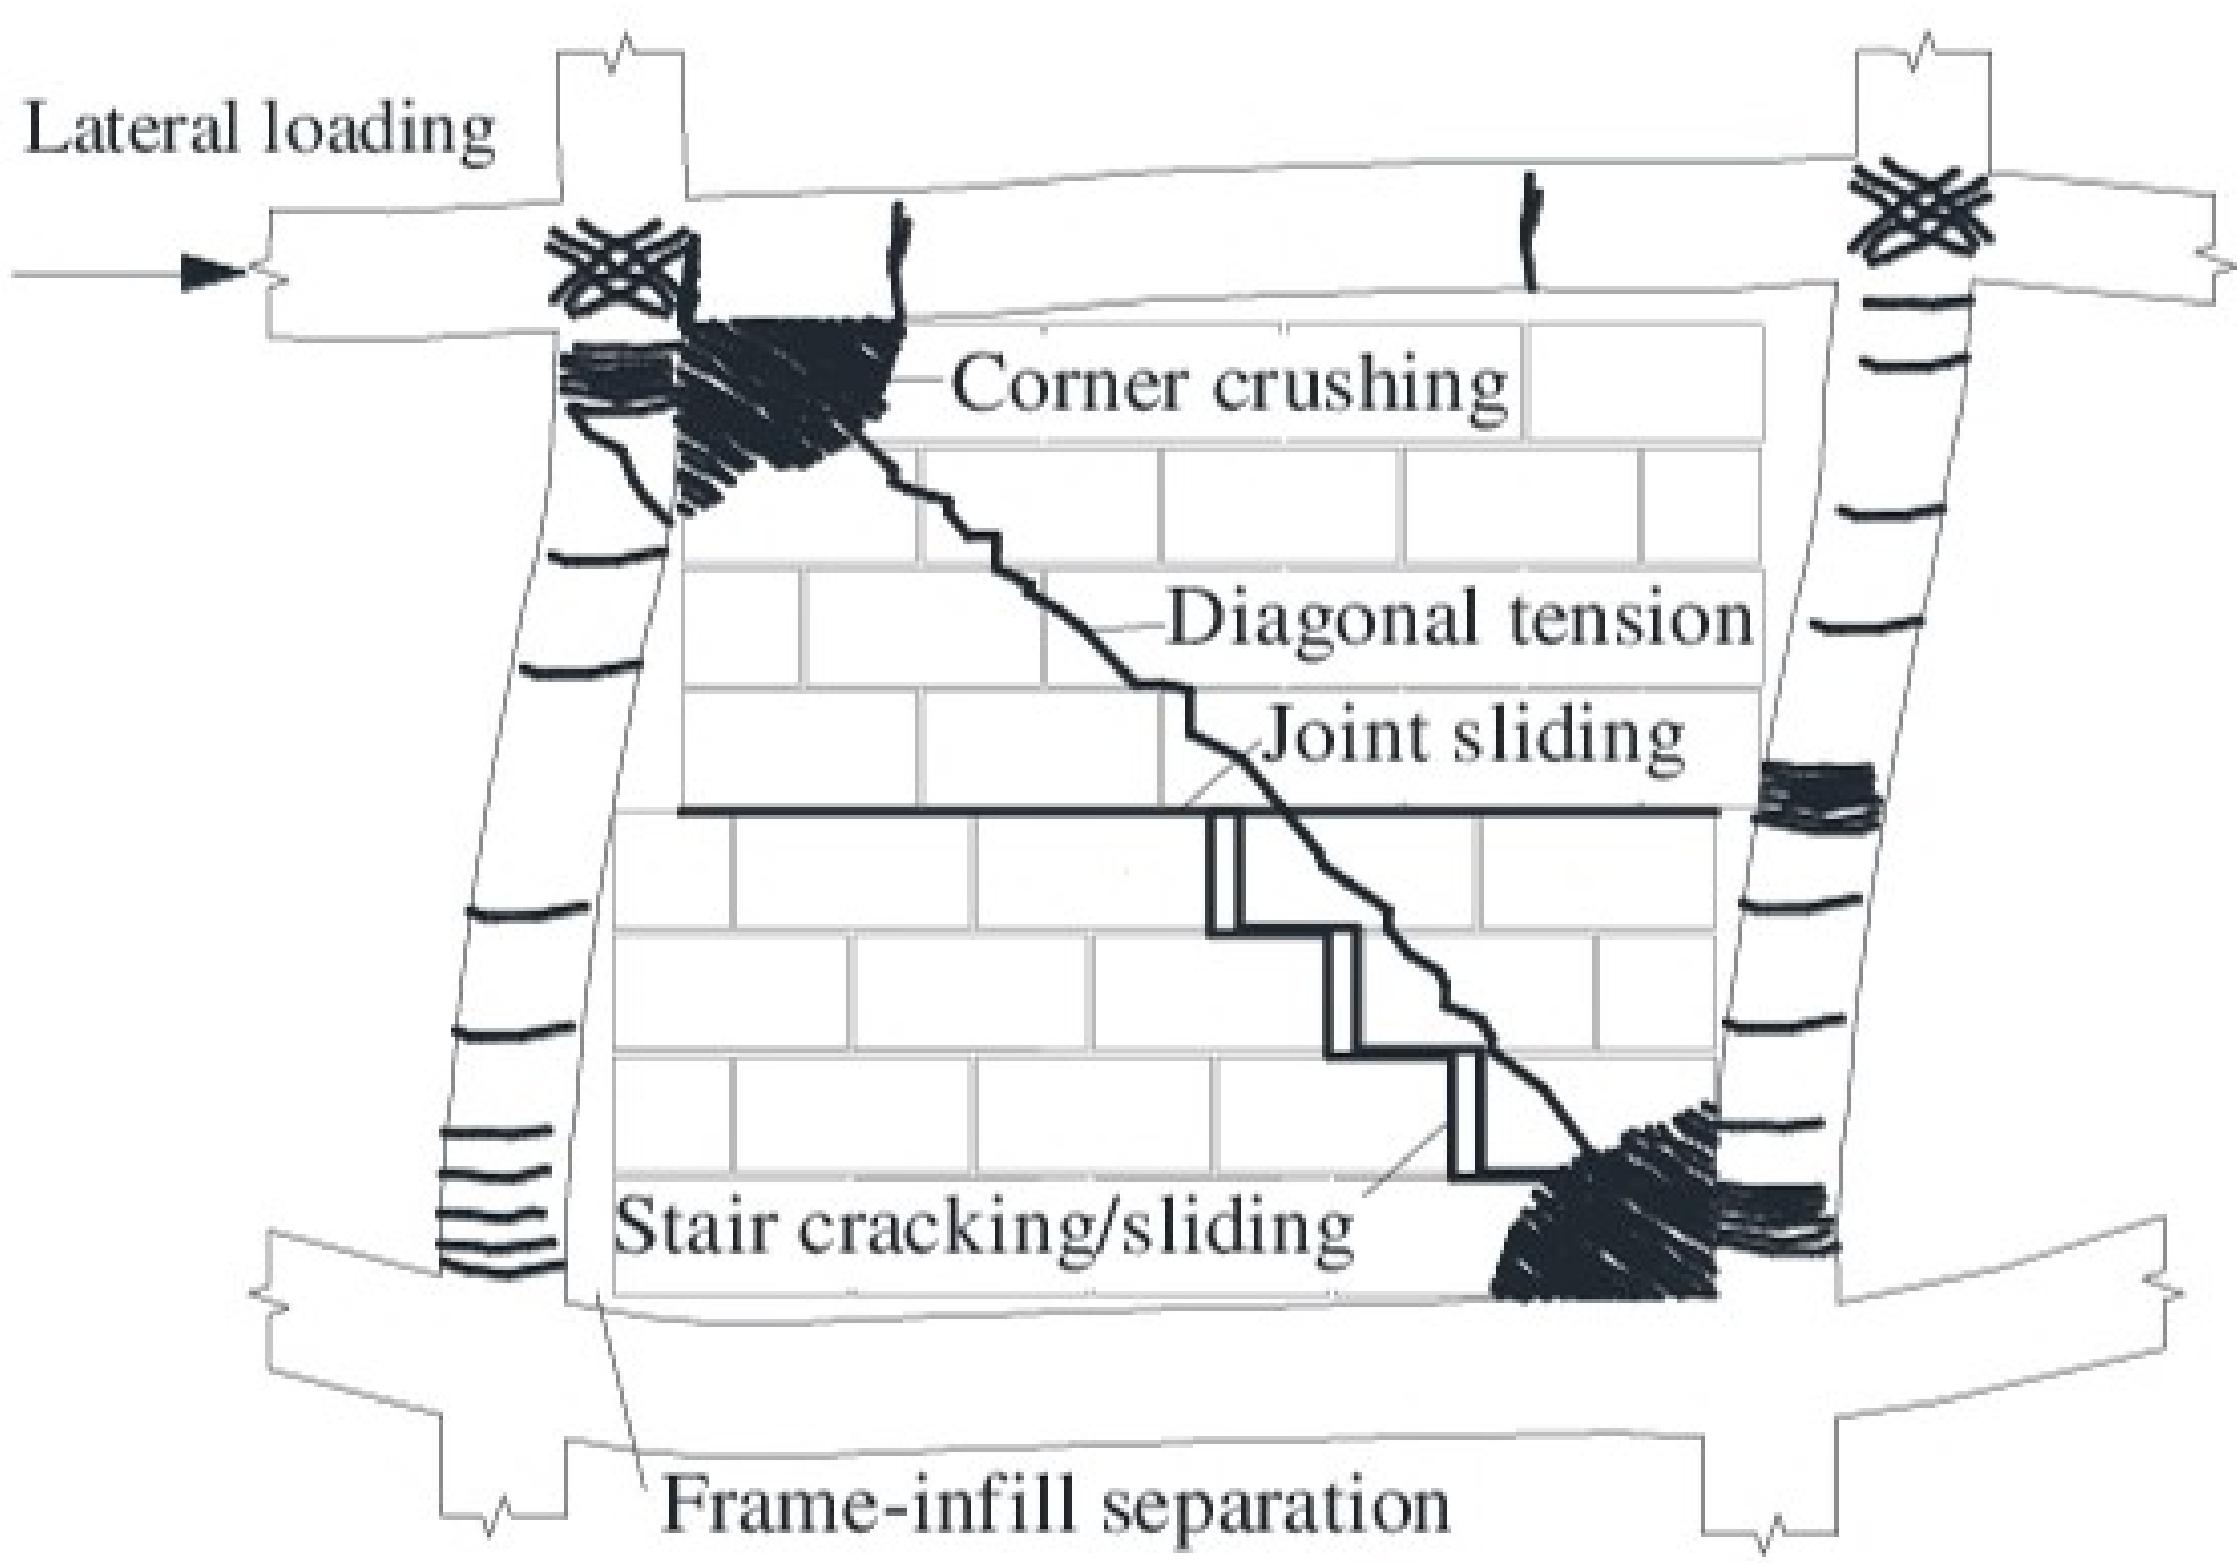

Local

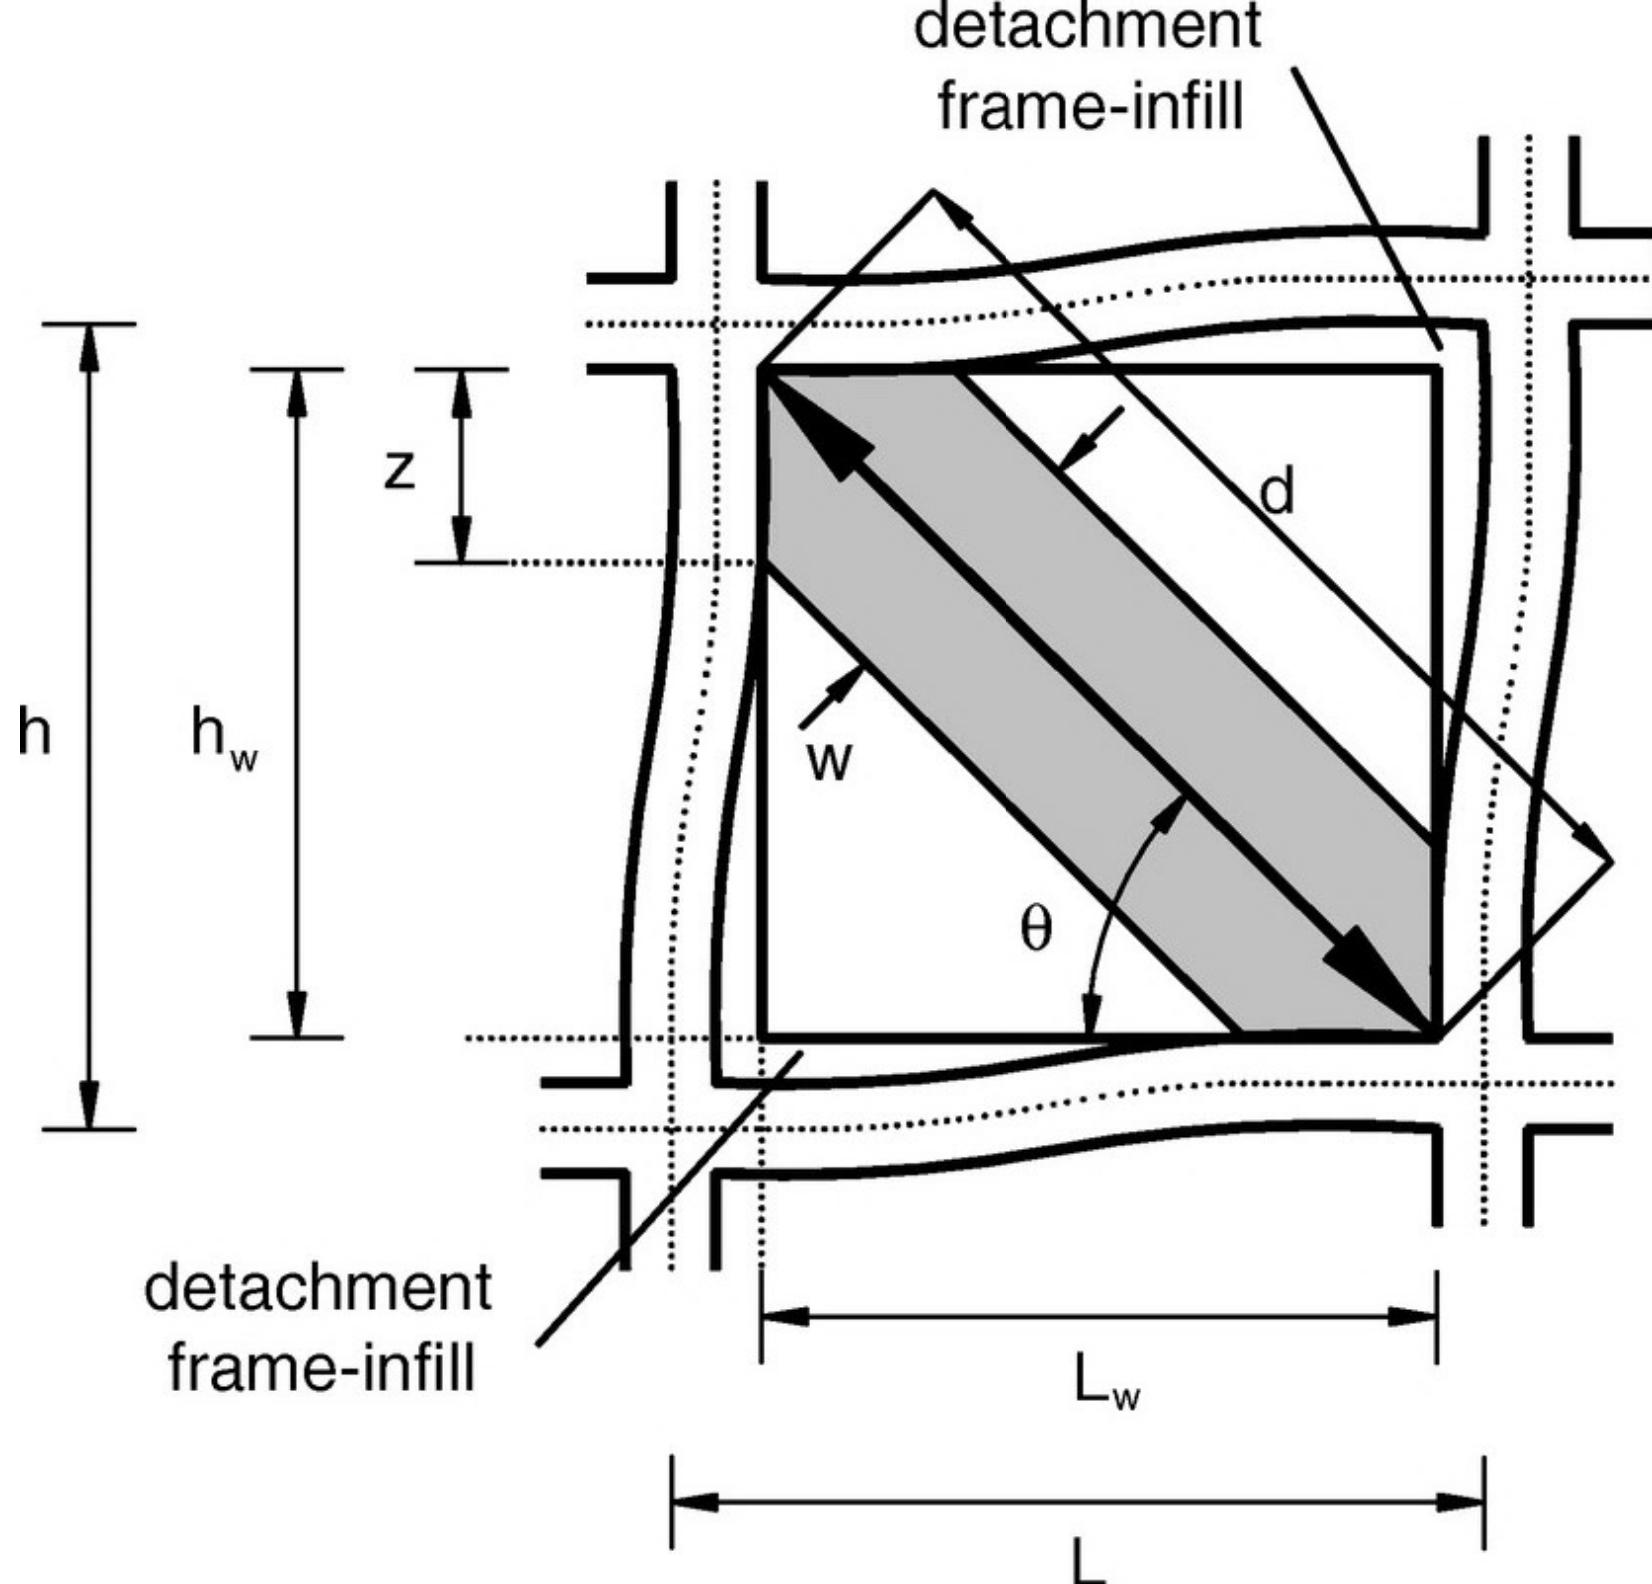

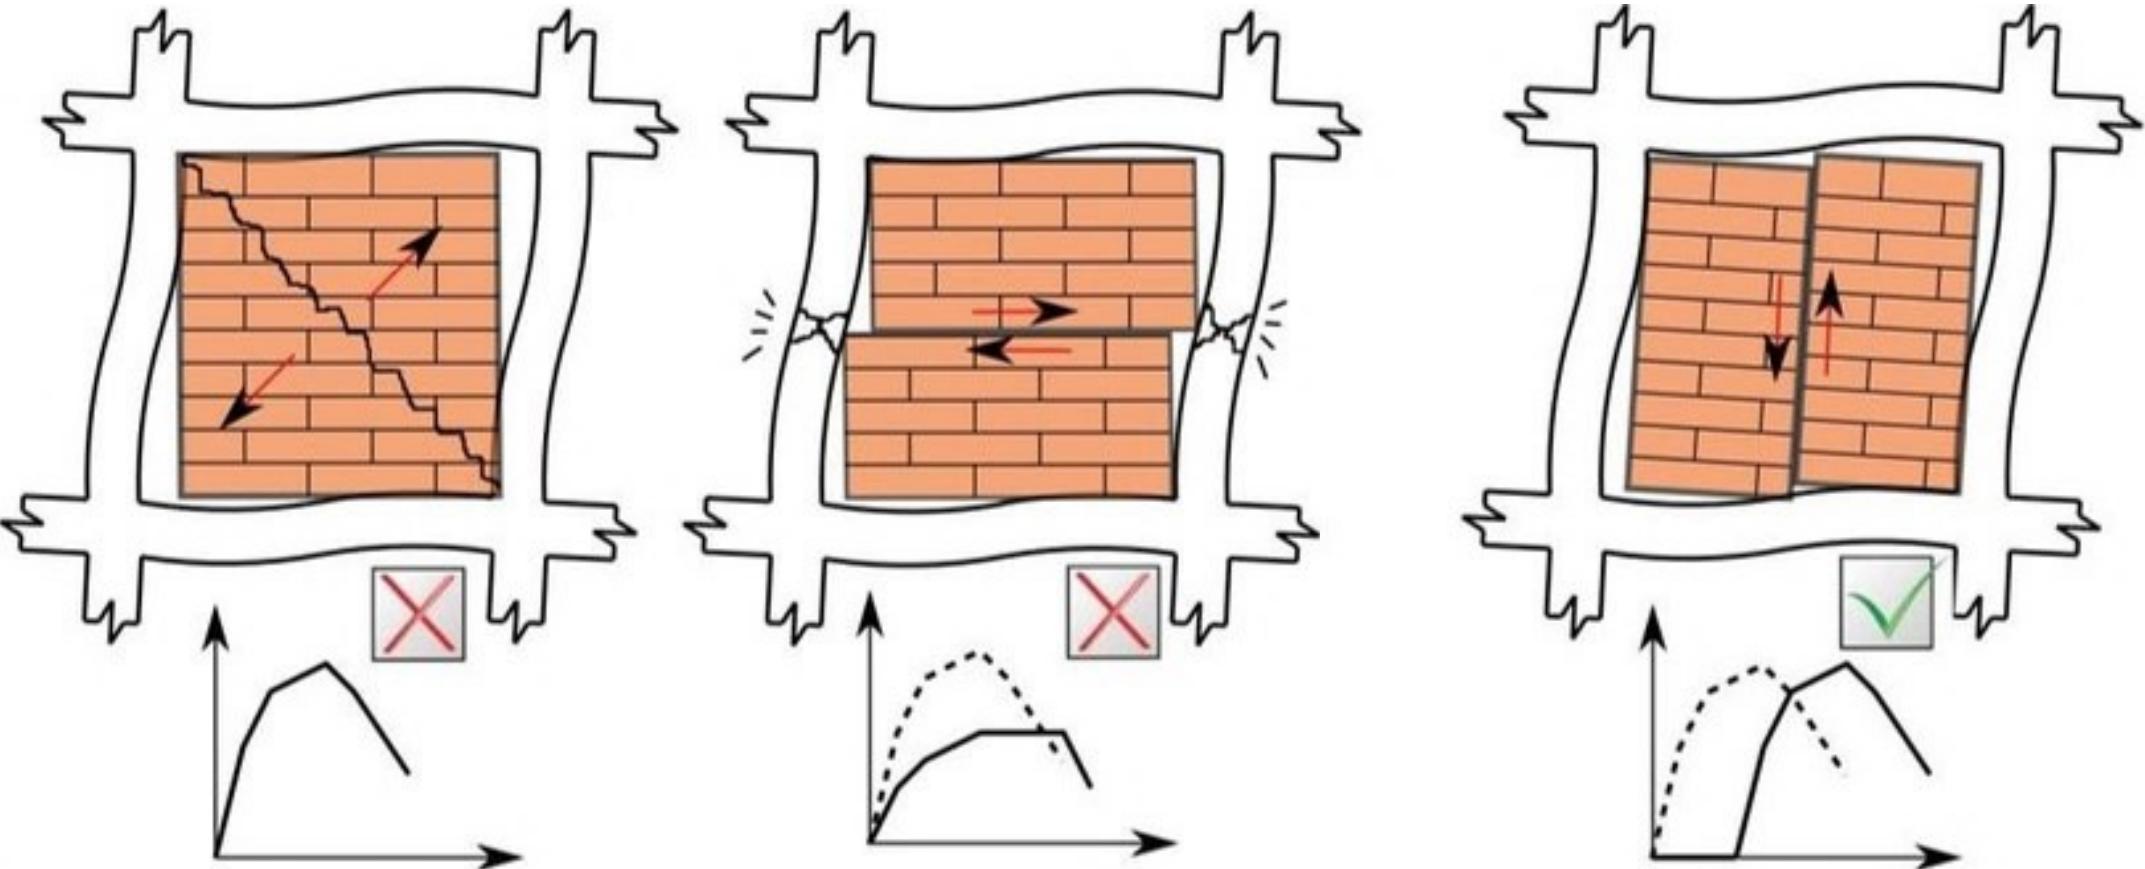

IN-PLANE

Global

As Built Infill Wall

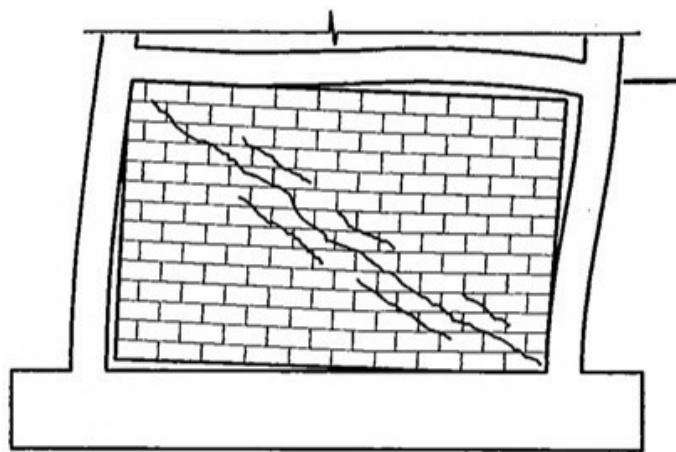

- Brittle strut mechanism
- Low deformation capacity
- Brittle diagonal cracking

Sliding Infill Wall

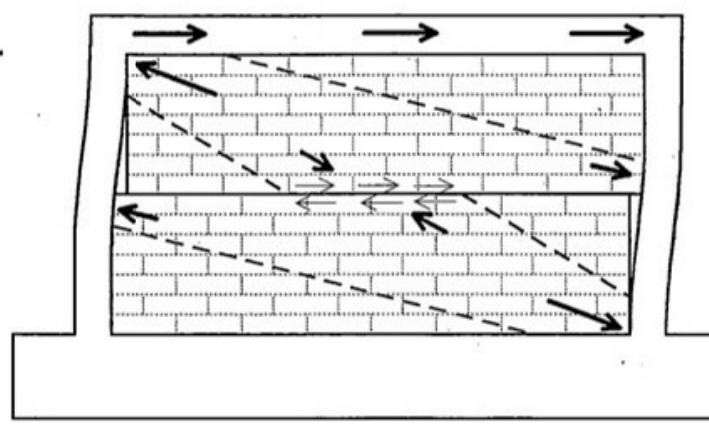

- Ductile sliding mechanism
- Low-moderate deformation capacity
- Potentially brittle column shear failure

Rocking Infill Wall (Low Damage)

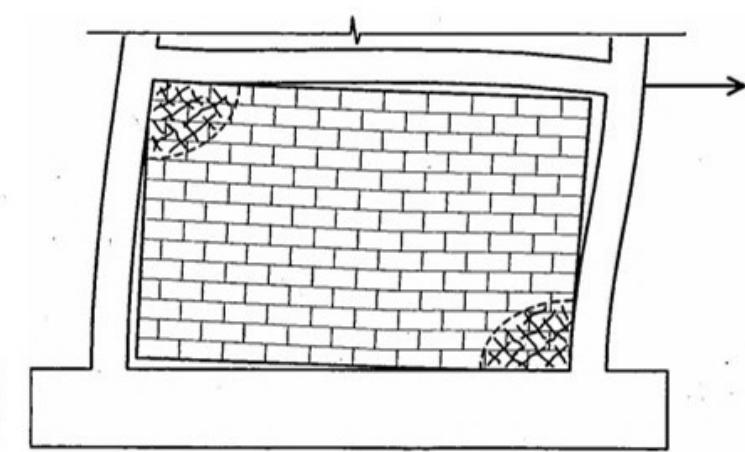

- Ductile cantilever wall mechanism
- Moderate-high deformation capacity (Controlled by the amount of gaps)
- Delayed strut action by vertical gaps (low damage)

Puntal diagonal
